

Protected 1-A High-Side Load Switch

APPLICATIONS

- Peripheral Ports
- Hot Swap
- Notebook Computers
- PDAs

FEATURES

- 1 A Continuous Output Current
- 2.4 V to 5.5 V Supply Voltage Range
- User Settable Current Limit Level
- · Low Quiescent Current
- Undervoltage Lockout
- Thermal Shutdown Protection
- Compatible with AAT4610A
- · 4 kV ESD Rating-HBM

ROHS

DESCRIPTION

SiP4610A/B is a protected highside power switch. It is designed to operate from voltages ranging from 2.4 V to 5.5 V and handle a continuous current of 1 A. The user settable current limit protects the input supply voltage from excessive load currents that might cause a system failure. SiP4610A/B has a low quiescent current of 9 μA and in shutdown the supply current is reduced to less than 1 μA . In addition to current limit, the SiP4610A/B is protected by undervoltage lockout and thermal shutdown.

There are two versions of the SiP4610. The SiP4610A has an active low enable input, while the SiP4610B has an active high enable input.

The SiP4610A/B is available in a lead (Pb)-free 5-pin thin SOT-23 package for operation over the industrial temperature range of - 40 to 85 °C.

TYPICAL APPLICATION DIAGRAM

ABSOLUTE MAXIMUM RATINGS (All voltages refer	renced to GND = 0 V)	
Parameter	Limit	Unit
$V_{IN}, V_{\overline{ON}}, V_{ON}$	- 0.3 to 6	V
I _{MAX}	2	Α
Storage Temperature	- 65 to 150	°C
Operating Junction Temperature	- 40 to 150	°C
Power Dissipation ^a , SOT-23 5-Pin	305	mW
Thermal Impedance $(\Theta_{JA})^{b}_{,}$ SOT-23 5-Pin	180	°C/W

Notes:

- a. Derate 5.5 mW/°C above $T_A = 70$ °C.
- b. Device mounted with all leads soldered or welded to PC board.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PIN DESCR	RIPTION	
Pin Number	Name	Function
1	OUT	Switch Output.
2	GND	Ground pin.
3	SET	Current limit level set pin. The level is determinied by the value of a resistor connected from this pin to GND.
4	ON/ON	Shutdown pin. ON, active low on the SiP4610A and ON, active high on the SiP4610B.
5	IN	Input supply voltage and switch input.

FUNCTIONAL BLOCK DIAGRAM

Figure 1. SiP4610 Block Diagram

VISHAY.

DETAILED DESCRIPTION

The SiP4610 limits load current by sampling the pass transistor current and passing that through an external resistor, R_{SET} . The voltage across R_{SET} , V_{SET} , is then compared with an internal reference voltage, V_{REF} . In the event that load current surpasses the set limit current, V_{SET} will exceed V_{REF} causing the pass transistor gate voltage to increase, thereby reducing the gate to source voltage of the PMOS switch and regulating its current back down to I_{LIMIT} .

Setting the Current Limit Level

Setting the current limit level on the SiP4610 requires some care to ensure the maximum current required by the load will not trigger the current limit circuitry. The minimum current limit threshold should be determined by taking the maximum current required by the load, I_{LOAD} , and adding 25 % headroom. The SiP4610 has a current limit tolerance of 25 %, which is largely a result of process variations from part to part, and also temperature and V_{IN}/V_{OUT} variances. Thus, to ensure that the actual current limit is never below the desired current limit a 1/0.75=1.33 coefficient needs to be added to the calculations. Knowing the maximum load current required, the value of $R_{\rm SET}$ is calculated as follows.

$$R_{SET} = R_{SET}$$
 coefficient/ I_{LIMIT}

where $I_{LIMIT} = (I_{LOAD} \times 1.33) \times 1.25$ and R_{SET} coefficient is 7100 for a 1 A current limit. For typical R_{SET} coefficient values given a limit current refer to the "Typical Characteristics" section.

Operation at Current Limit and Thermal Shutdown

In the event that a load higher than I_{LIMIT} is demanded of the SiP4610, the load current will stay fixed at the current limit established by R_{SET} . However, since the required current is not supplied, the voltage at OUT will drop. The increase in V_{IN} - V_{OUT} will cause the chip to dissipate more heat. The power dissipation for the SiP4610 can be expressed as

$$P = I_{LOAD} x (V_{IN} - V_{OUT})$$

Once this exceeds the maximum power dissipation of the package, the die temperature will rise. When the die temperature exceeds an over-temperature limit of 165 °C, the SiP4610 will shut down until it has cooled down to 145 °C, before starting up again. As can be seen in the figure below, the SiP4610 will continue to cycle on and off until the load is reduced or the part is turned off (See Figure 2).

The maximum power dissipation in any application is dependant on the maximum junction temperature, $T_{J(MAX)} = 125~^{\circ}\text{C}$, the junction-to-ambient thermal resistance for the SOT23-5 package, $\theta_{J-A} = 180~^{\circ}\text{C/W}$, and the ambient temperature, T_A , which may be formulaically expressed as:

$$P(max) = \frac{T_J(max) - T_A}{\theta_{J-A}} = \frac{125 - T_A}{180}$$

It then follows that assuming an ambient temperature of 70 $^{\circ}$ C, the maximum power dissipation will be limited to about 305 mW.

Reverse Voltage

The SiP4610 is designed to control current flowing from IN to OUT. If the voltage on OUT is raised higher than IN current will flow from OUT to IN but the current limit function will not be available, as can be inferred from the block diagram in Figure 1. Thus, in applications were OUT is used to charge IN, careful considerations must be taken to limit current through the device and protect it from becoming damaged.
